Different somatic calls across Monopogen v1.0 and v1.6.0 #58

We are following the example here and noticed the following overlap with the example data between somatic SNV calls made from scRNAseq with v1.0 and v1.6.

Are you surprised that ~25% of the variants differ between versions? Do you think that the v1.6 calls are more trustworthy?

Thanks for any input that you have and for building this wonderful tool.

Thanks for you posting such comparison. Your testing is based on our chr20 MAESTER dataset or yourself? I will look at a bit and feedback to you soon.

Hey,
do you have an update here? 🙏

jinzhuangdou on Jun 23, 2024

Hi, could you try the new version (updated in Jun 23,2024)? Only running the LDrefinement step is okay. The current version v1.6.0 imposes more filtering than v1.0.1. In v1.0.1, I noticed there are some loci with multi-alleles. This leads to the inconsistency on sequencing depth counting. The new version has fixed this issue.

Another is you can check whether the discordance loci between two versions are both low sequencing depth. The updated version is the optimal one.
